GOVERNING ENTERPRISE AI:
RISK, COMPLIANCE, AND CONTROL

As enterprise AI becomes more embedded in business operations, organizations need greater visibility and control over how their systems use data and make decisions. In the 2026 AI-Readiness study, only 33% of respondents said their AI models could fully reference source data, transformations, and business rules.

Governance and compliance also ranked as the most frequently cited challenge in building an AI-ready architecture. Enterprise AI World's February Best Practices Report will explore strategies and technologies to manage risk, protect sensitive information, support compliance, and maintain accountability across the AI lifecycle.

THE REPORT WILL ADDRESS

- Building and operationalizing an enterprise AI governance framework
- Managing risk and compliance across the AI lifecycle
- Protecting sensitive data and controlling access
- Improving transparency, traceability, and accountability
- Governing AI agents and autonomous workflows

SPONSORSHIP OPPORTUNITY

Share your expertise and connect with enterprise decision-makers seeking to deploy AI responsibly and at scale.
